

Elderly people generally want to continue to live in their own house, or a place that offers the option to have a relatively high level of independence. But, as the risk for health problems increases with age, often these people want to have a system at their disposal to call for nursing care/assistance if or when necessary.

## Nurse call/medical assistance alarm

A Nurse Call/Medical Assistance Alert system is the ideal solution for these cases. We offer these systems for applications within the residence, but also for satellite locations that may be far away. We then use the public network options (ISDN, ADSL, .) as leased lines or not, to make the connection between the physical locations.

### Customized

As with all our products, you determine, together with CLB, what the best solution is for your specific situation. Do you need to integrate your solution with other communication systems? Many questions need to be asked and answered in order to determine the right solution for you. CLB will assist you with this, and is always able to offer you a solution which will meet your existing requirements whilst being flexible for your future.

### Applications

Our Medical Assistance Alert/Nurse Call system has proven itself in many buildings and institutions. Particularly elderly care, collective housing for mentally disabled people, psychiatric institutions and elderly homes and of course hospitals are places where you often find our systems.

### Call unit

CLB offers a call unit based on a modular concept and which can be configured to your demands. The modular system allows you to add modules for speech or an extra unit for free programmable buttons, which can for example be assigned to open a (central) door, control the voice communication, control the awnings or anything else you might think of.

Call unit with speech and programmable buttons

The units have the option to connect to a camera and/or an LCD screen. Furthermore, we can provide prints on the units and/or produce them in a colour that you like.

Furthermore, we can provide prints on the units and/or produce them in a colour that you like.

For home situations we offer special phones or devices as displayed below, that you can put under your phone and are designed with only 3 buttons in three colours. The simplicity of this design makes it easy to use.

### Speech

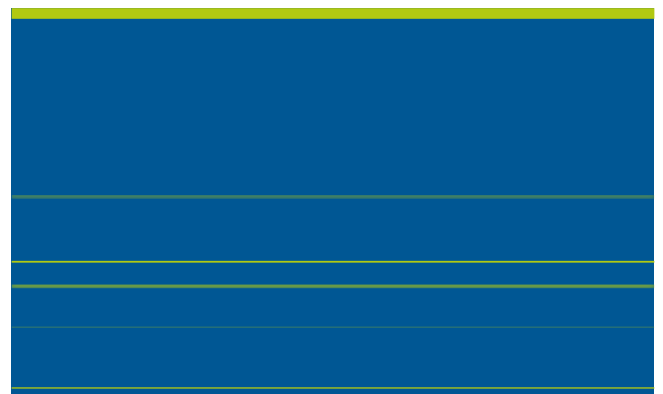

Because speech can be integrated with the Medical Assistance Alert/Nurse Call unit you can increase the options you have with this unit. Medical staff can have direct communication with the person who called for assistance to assess the urgency of the call. It is also possible, if not prohibited by local privacy restrictions, to open a voice connection to "listen in", or even have a video connection.

### (Re-)directing incoming calls

Incoming calls can be sent to a central monitor (PC), a DECT phone, a pager or even a PDA. With unicare® you also have the option to send the call to a monitor for example during the daytime and to a phone during the night.

Antenna care phone

## Cabling

Our systems have minimum cabling requirements (3 copper wires), and therefore we can often use existing cabling, saving you a substantial investment.

## Expandable with other unicare® concepts

The modular concept of unicare® enables you to expand the system at any time with systems or products from one or more of the 12 unicare® concepts. In the case of Medical Assistance Alert/Nurse Call systems, one can easily image integration with Acoustic Surveillance, Domotics and/or Calamity Call systems. Besides integration with unicare® concepts, integration with third party systems is also possible.
